

Lab 2: Agile Backlog Creation & Sprint Simulation in Jira

PROBLEM STATEMENT #39

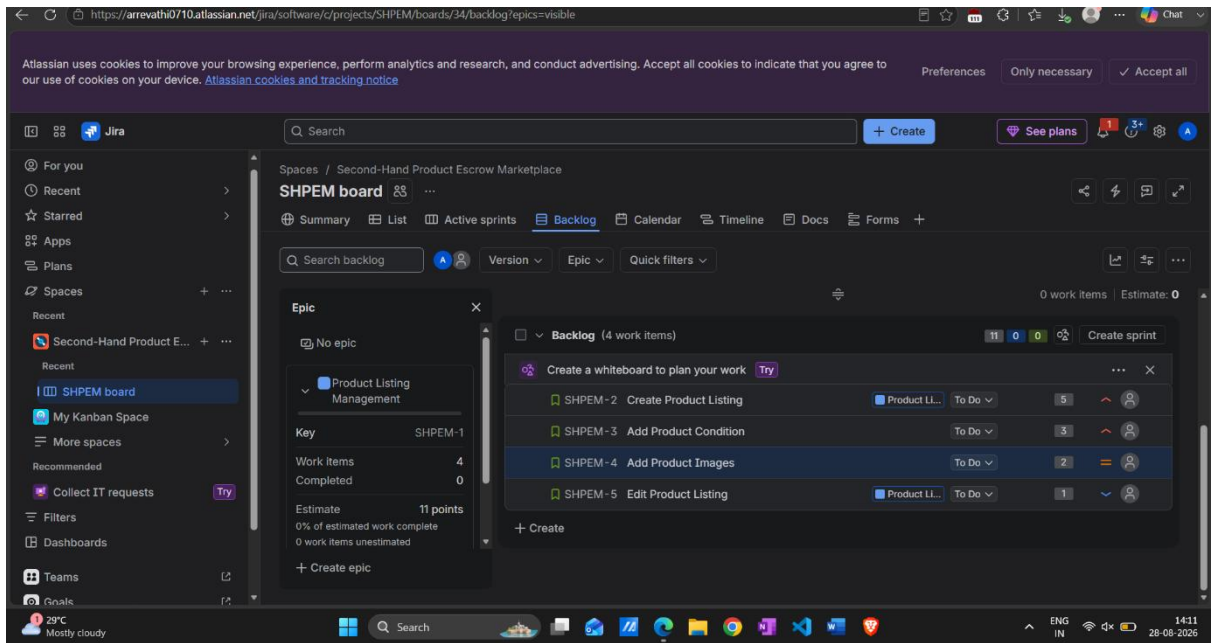

Second-Hand Product Escrow Marketplace

Name: Revathi D B	SRN: PES1UG24CS604	Section: J
-------------------	--------------------	------------

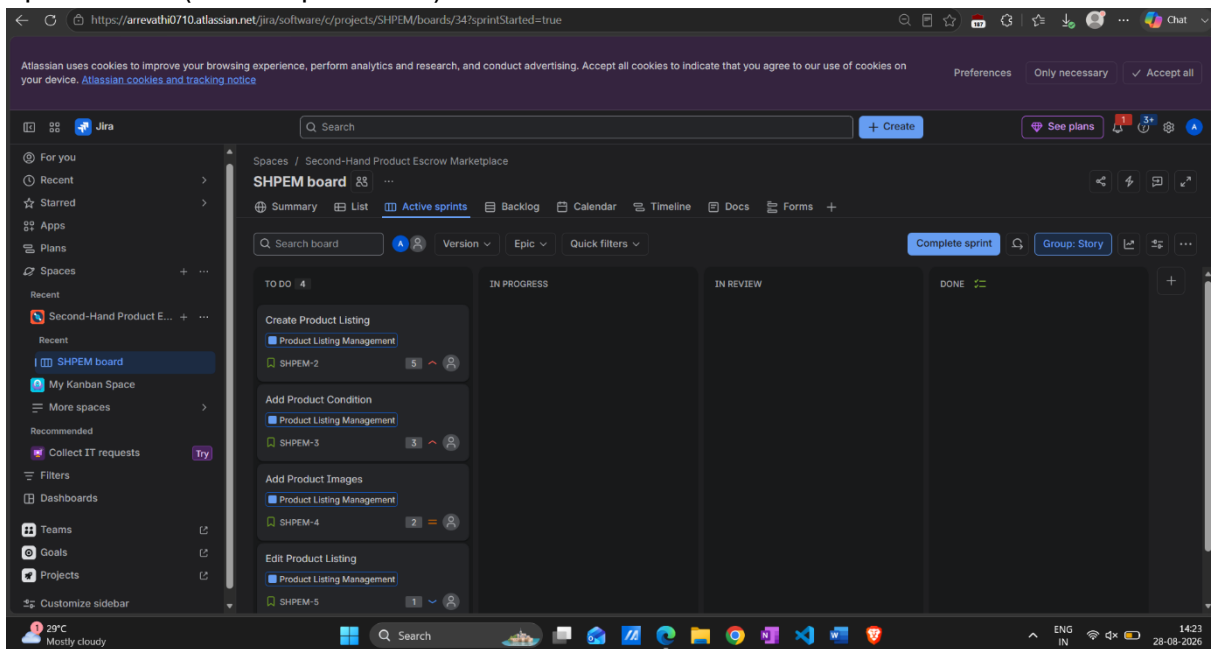

1. Jira backlog with Epics and User Stories:

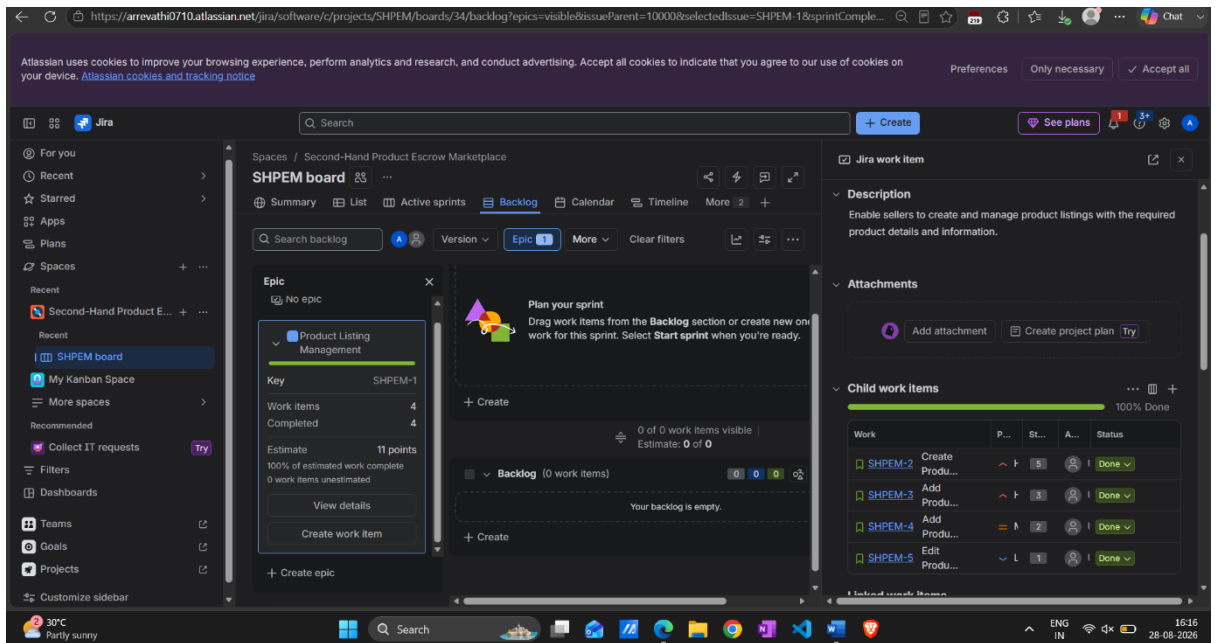

2. Story point assignments:

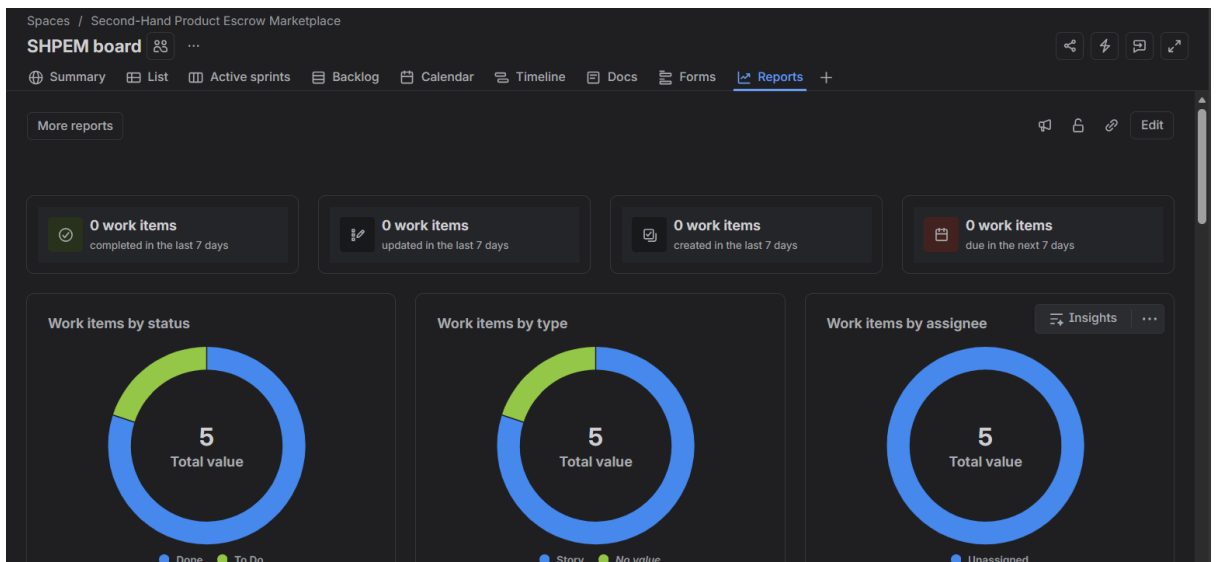

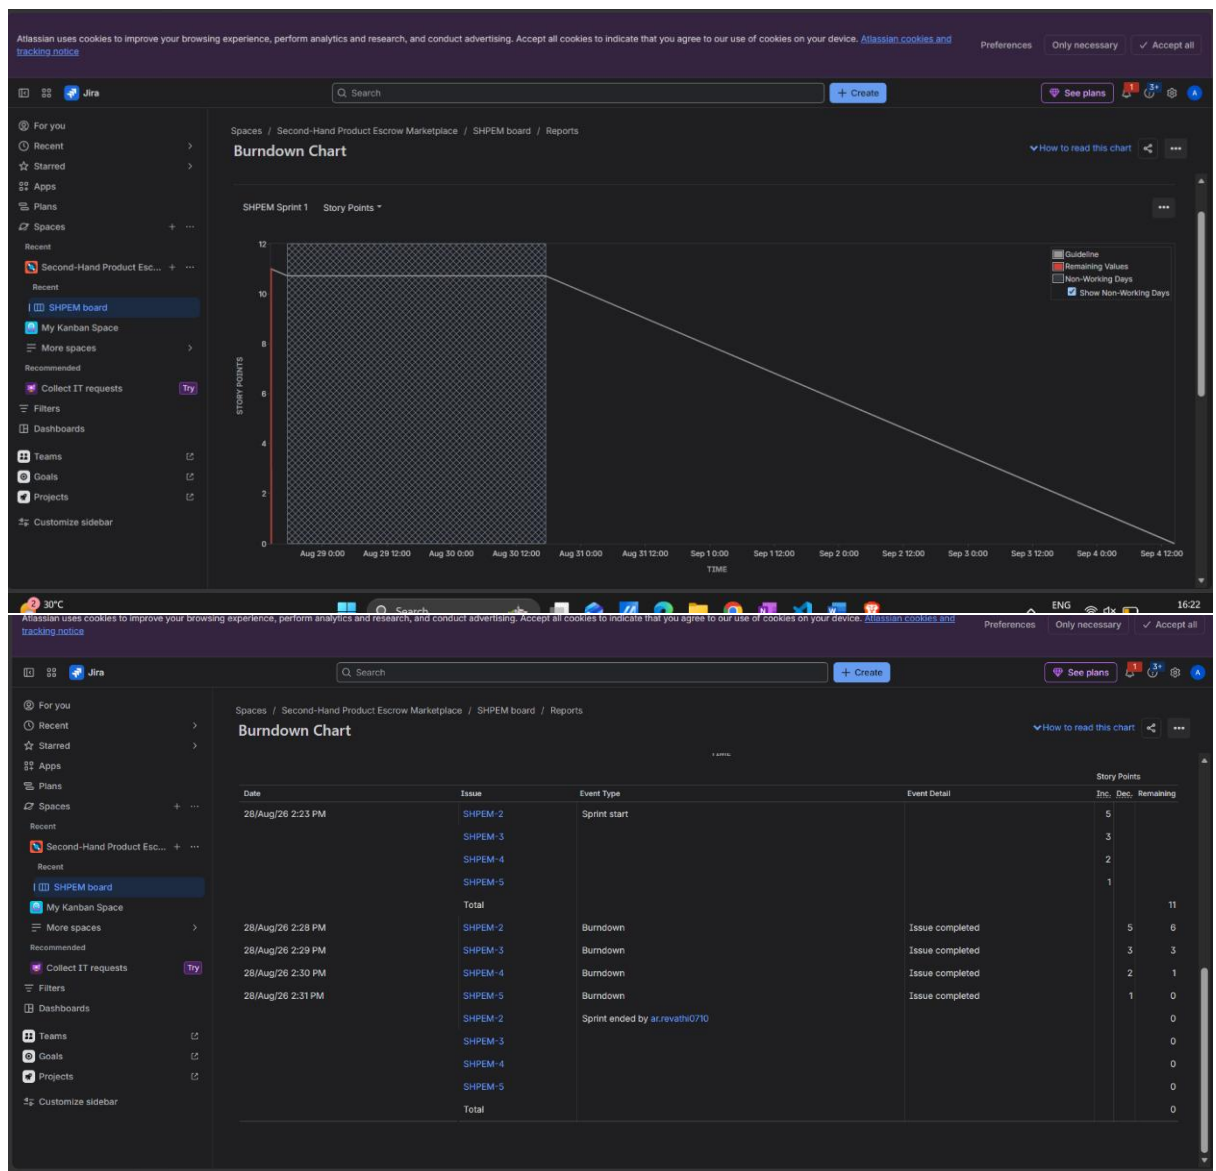

3. Sprint board (Active Sprint view):

4. Burndown Chart:

1. Did your estimations reflect the actual effort?

Yes, the estimations reasonably reflected the relative effort required for each user story. The stories were assigned 5, 3, 2, and 1 story points, with "Create Product Listing" being the most complex and "Edit Product Listing" being the least complex. Since all four stories were completed during the simulated sprint, the estimates were useful for representing the differences in complexity and workload.

2. Was your backlog well-prioritized?

Yes, the backlog was reasonably prioritized based on the importance and dependency of the product listing features. Create Product Listing was given the highest estimate of 5 points, followed by Add Product Condition (3 points), Add Product Images (2 points), and Edit Product Listing (1 point). This provided a logical order of work, with the core listing functionality receiving the most importance.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned well with the plan. All four user stories, totaling 11 story points, were moved into Sprint 1 and completed successfully. The sprint board showed the planned work items and their progress through the workflow. This indicates that the sprint scope was manageable and the planned work was completed within the simulated sprint.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed that the sprint started with 11 story points and reached 0 remaining points after all four stories were completed. This indicates that the team was able to complete the entire planned workload in the simulated sprint. It also suggests that the selected sprint scope was within the team's simulated capacity. However, because this was a simulated sprint completed in a very short period, the result should not be treated as a realistic measure of long-term team velocity or capacity.
